Who Can Benefit From Permanent Cosmetics

People who:

- Have unsteady hands and/or poor eyesight
- Are physically challenged
- Have thin or sparse eyebrows and/or eyelashes
- Have common makeup allergies
- Have permanent hair loss
- Have oily skin
- Have Alopecia, Cancer Scars, Hyper & Hypo-Pigmentation, Vitiligo, or are Burn Survivors
- Have asymmetrical facial features
- The common everyday busy person who wants to look their best quickly
- Women who travel and/or are active in recreational sports
- Have had surgical procedures (scars can be camouflaged)
- People that need to create the illusion of areolas and nipples after breast reconstructive surgeries
- Men who may want permanent color to give the look of fuller eyebrows, or to mask the effects of hair loss, or to camouflage scars
- Men of alternative life styles

Does it hurt?

With my pain elimination procedures, the procedure will be pain free. I have mastered the steps necessary to pre-deaden the skin for all permanent makeup procedures. This ensures your anesthetics have reached their peak performance, before any procedure is started. This is crucial to ensure your comfort, and to enable the application of more color with less trauma to the skin.

How safe is this procedure?

Permanent cosmetic procedures are safe, if the technician has had proper education and follows all of OSHA and CDC guidelines. Single use, sterile needles and machine parts

are used for each client and than properly disposed of.

How will I look immediately following my procedure?

Your procedure area may be slightly swollen and irritated. This is called a 'wheal and flare' reaction. The area may also be darker for a few days while it is healing, because of the lymph and blood droplets that may have been brought up to the surface during your application. While your procedure area is healing, it must go through three phases before you will experience your final results. The procedure area must heal, peel and fade. Final results may take 4-8 weeks to completely heal.

Can I have permanent makeup if I'm allergic to regular makeup?

If you are allergic to traditional facial makeup, Permanent Makeup is ideal for you. The technician will patch test you in the desired area, wait 6-8 weeks, and proceed as necessary.

How do I care for my 'NEW' permanent makeup?

After completion, you will receive a post-treatment care instructional sheet. The overall success of your procedure is contingent upon you following these instructions. A follow-up visit will be scheduled approximately 4-6 weeks from your initial application. This is to tune and touch up any areas that aren't completely to your satisfaction at no additional charge to you.

Is this procedure truly permanent?

Your permanent makeup procedure depends upon the technician, the products used for the application, the correct setting for the proper angle and depth of the cosmetic tattoo machine, how well you take care of the applied area while healing, and weather or not sun block was used after the procedure up to prior to healing. All these are factors towards longevity of results.

Can a person taking medication have a permanent makeup procedure?

Clients on medication should obtain a release from their physician prior to any permanent cosmetic makeup procedure. It is required that the release be from a physician's prescription note pad and sent to the technicians office prior to the procedure.

What precautions, if any, are there prior to a procedure?

If there is any history of cold sores or fever blisters, you must take an antiviral prior to the procedure. Your physician should prescribe Valtrex, Famvir or Zovirax. Herpetic outbreaks usually occur on the 3rd day post procedure, and taking anti-virals will reduce your chance of an outbreak. If you experience a Herpetic out-break, you will lose the implanted pigment color in the area of the out-break.
